Revolutionizing Quranic Learning with AI

Department: Computer Science / Software Engineering

University: Cairo University

Project Field: Software Engineering and Artificial Intelligence

Qurany aims to bridge the gap between traditional Quranic learning and modern technology, offering an accessible and advanced tool for global users.

Addressing the Need for Accessible Quranic Education

The personal and practical challenges of memorizing and reviewing the Holy Qur'an have driven the creation of Qurany. Limited availability of qualified teachers (Sheikhs) and unreliable alternatives create significant barriers for learners seeking accurate feedback and correction.

Existing digital solutions, such as Tarteel AI, offer promise but often lack crucial features, flexibility, and affordability, locking advanced capabilities behind paid subscriptions. This highlighted a clear need for a comprehensive, free, and inclusive platform.

OUR VISION

Qurany: Free, Feature-Rich, and Accessible

Feature-Rich

Beyond basic recitation, offering a holistic learning experience.

OUR VISION

Qurany: Free, Feature-Rich, and Accessible

OUR VISION

Qurany: Free, Feature-Rich, and Accessible

Global Reach

Serving Qur'an learners worldwide.

PROJECT DESCRIPTION

Intelligent Recitation Correction and Islamic Companion

Qurany is an Islamic application designed to significantly enhance Quran recitation. Users recite verses aloud, and the system intelligently listens, recognizes the verse, and displays the correct text. It then meticulously compares the user's recitation with the original, highlighting any mistakes or differences.

This core feature empowers users to practice memorization, verify accuracy, and receive real-time guidance. The application will also integrate various helpful Islamic features, including a full Quran reader, search capabilities, bookmarking, prayer times, Azan notifications, Qibla direction, and daily Islamic reminders like Duas and Hadiths.

Qurany: Workflow Diagram

This diagram illustrates the core components of Qurany, from user input to intelligent feedback and the integration of comprehensive Islamic features.

From Research to Deployment

01

Initial Research & Documentation

Studied existing Quran learning apps, speech-to-text, and defined project scope and architecture.

02

Experimental Prototype

Developed a Python prototype for Quran recitation transcription, validating AI feasibility.

03

Live Recitation Module

Developing real-time verse recognition and mistake highlighting. Exploring various Qirā'āt.

04

Feature Integration

Adding Quran reader, bookmarks.

05

Testing, Refinement & Deployment

Finalizing the Android app and potentially a web version based on project requirements and available time.

Our flexible plan includes the potential for advanced Tajweed level recognition, if feasible with available AI capabilities.

Potential Beneficiaries of Qurany

Institutional Adoption

- **Ministry of Communications and IT (MCIT):** For digital Egypt initiatives.
- **Ministry of Awqaf & Al-Azhar Al-Sharif:** Key religious education authorities.
- **Islamic Education Institutions:** Quran memorization centers and schools.

End-Users

- **Quran Students & General Muslim Population:** Individuals seeking to improve recitation and memorization.
- **Parents & Tutors:** Supporting children and learners in Quranyc study and progress tracking.

Empowering the Global Ummah with Qurany

Our project is more than an application; it's a commitment to fostering a deeper connection with the Holy Qur'an through innovation and accessibility. We aim to support millions worldwide in their Quranic journey.
